

CUBE Line Floor drain type 150 Brush connection element made of stainless steel (AISI 316)

An elegant design in harmony with perfect performance. CUBE Line from BEHNCKE. The state of the art in flush fittings.

BEHNCKE's developers realized at an early stage that the demands placed on the design and style of flush fittings for pool design, landscaping, and interior design were becoming increasingly reduced and puristic. With the new CUBE-Line series BEHNCKE has demonstrated its innovative strength once again and in doing so, as with the award-winning 'B 500 Slim' surface skimmer, has provided proof of its trendsetting brand image: Always an idea ahead!

CUBE Line floor drain type 150, for concrete and liner pools.

The special design features are the extremely low overall height and the impressive finish. The visible surface is elaborately mirror polished, with the edges adapted at a 45-degree angle so as to be touch-friendly. The faceplate is designed to be installed flush with the floor in order to reduce the danger of injury. Designed with a generous 2" outlet this BEHNCKE fitting is impressive in practice thanks to its high outflow volume. The large-sized filter faceplate also facilitates sophisticated installation work (e.g. in tiled pools).

The flexible attachment of the suction connection, i.e. allowing alignment with the relevant requirements, is a special feature of BEHNCKE.

CUBE Line floor drain type 150 for prefabricated pools with an anti-turbulence cover.

Equipped with the same quality and design features, the CUBE-Line floor drain for prefabricated pools also has an anti-turbulence cover. This design detail, which was developed by BEHNCKE's technicians, guarantees uniform, extensive and pleasant pool hydraulics thanks to the significantly reduced turbulence in the outflow area. Furthermore, the floor outflow is inlaid with inner-sealing stud bolts that are an integral part of the inner seal. This design feature lastingly prevents the osmosis process (a FRP plague) at interfaces and breakthrough points when installing in one-piece pools.

CUBE Line element for concrete and foil pools.

CUBE Line element for prefabricated pools.

Creativity means: being aware of small details. For us, this is the seed of intelligence. Especially when it comes to high-quality flush fittings.

In the construction of quality swimming pools, flush fittings are details that function constantly and reliably, usually in the background or concealed. They are therefore indispensable for the fault-free overall functioning of a complex pool system. The inference for BEHNCKE's technicians is: To explicitly not pay any less attention to small details.

It is exactly this synergy, consisting of a high degree of craftsmanship and high-tech production in conjunction with sophisticated and aesthetic design that is created at our production site in Putzbrunn, in the vicinity of Munich. Made in Germany.

CUBE Line broom connection element for concrete and liner pools.

Broom connection elements, due to their optimal accessibility - in comparison to a conventional suction connection in the skimmer - are a lot more convenient to use and considerably facilitate the daily cleaning routine.

The reduced aesthetics of the CUBE Line design in conjunction with its constant operating reliability.

The use of very high-quality and resistant stainless steel (AISI 316) as well as the perfect mirror-polished finish - even the sealing plug is made of high-grade stainless steel - clearly emphasizes the quality standard and the perfection of every detail by BEHNCKE.

Equipped with an optimized 2" connector socket, this guarantees a high constant suction volume and therefore extremely effective cleaning power.

Available in two lengths (250 mm, 300 mm), this CUBE Line flush fitting is particularly suitable for concrete pools with various dimensions. With quick and perfect installation in mind, this element is delivered complete with a wall bushing, base element, faceplate and all the necessary seals and screws.

The CUBE Line broom connection element for prefabricated pools.

Right-angled installation especially for prefabricated pools is achieved by inclining the neck of the skimmer. This sophisticated geometry allows precisely fitting piping with very easy practical installation.

Also equipped with a high-performance 2" connection and a material quality of an adequately high grade, this special variant is particularly suitable for installation in one-piece pools or pools with a liner system.

The scope of supply includes the base element, faceplate, locking set and sealing washer (PVC). This creates the prerequisite for easy and perfect installation and at the same time guarantees constant operating reliability.
