

Floor drains made of stainless steel (AISI 316)

Your authorized dealer

For us, innovation means looking where others fail to see.

In contrast to plastic products, BEHNCKE stainless steel floor drains are particularly high-grade fittings. This is reflected, among other things, in the choice of the alloy components (with a high proportion of titanium and molybdenum), which easily attain the quality standard AISI 316, and in the excellent and tough surface quality. Innovative details, such as an internal flange (type 150) for a robust seal, are impressive evidence of the quality advantage provided by BEHNCKE fittings.

Floor drain type 190 for concrete and liners

This high-grade and universally usable floor drain made of stainless steel is particularly suitable for medium-sized and large-sized pools.

Through the generous design with a 2" outlet, this BEHNCKE fitting is impressive because of its high outflow volume. In addition the large-dimensioned and optically attractive strainer faceplate facilitates sophisticated installation work (e.g. in tiled pools). The flexible attachment of the suction connection, i.e. allowing alignment with the relevant requirements, is a special feature of BEHNCKE. Rivet nuts, another rational detail, mean that no additional sealing is required.

Floor drain type 150 for concrete and liners

Type 150 is the ideal floor drain for small- to medium-sized pools. Equipped with the identical material quality with regard to the alloy and finish, as well as the well thought-through equipment details of its big brother, type 190, it offers a low-cost but higher grade alternative to the plastic products frequently supplied in this sector.

Targeted detail optimizations, such as an elegantly designed new filter faceplate, ensure sustainable installation quality and constant operating reliability even in the entry-level segment.
